

User Guide

Conditional Statement

Conditional Statements in Python perform different computations or actions depending on whether a specific Boolean constraint evaluates to true or false. Now based on your experience, some materials are provided here. So choose intelligently. **It can save your time.** Condition is: whether you have used **if and else statements** in some other programming language or not?

```
if("You have" != "experience"):
    click(here)
else :
    click(here)
```

Note: Please practice [this](#).
